#### Presentation outline

- Introduction
- Objectives
- Materials and Methods
- Results
- Conclusions

### Introduction

- The goal of radiotherapy treatment planning is to design a beam configuration which will deliver a homogeneous dose to the specified planning target volume (PTV),
- ensuring that normal tissue receives a reasonably low dose and that critical organs receive less than their tolerance doses.

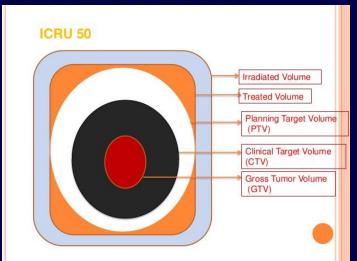

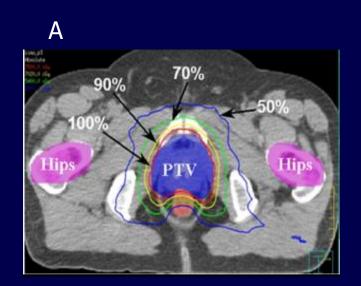

Figure 1: Treatment volumes

Page 3 of 10

# **Objectives**

■ The purpose of this study was to compare between 2-dimensional and 3-dmensional techniques for external-beam radiation treatment for prostate cancer.

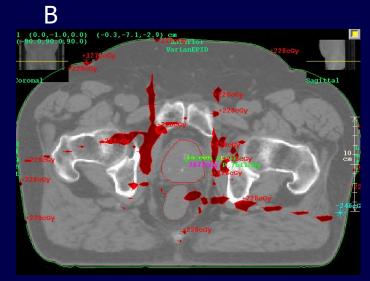

Figure 2 A &B: 3D and 2D Prostate treatment plan

Page 4 of 10

#### **Materials and Methods**

- Dose homogeneity within the target volume and doses to critical organs, OAR were evaluated.
- CT scans of 30 patients with localized prostate cancer were acquired and transferred to the treatment planning systems (TPS).

- The target volume and uninvolved structures were contoured on axial CT slices throughout the volume of interest.
- A comparison of the two treatment techniques was performed using isodose distributions, and dosevolume histograms.).

## Results

**Table 1:** The minimum, maximum, mean dose received in percent and total volume for the PTV and CTV.

| PTV                   |                           |                       |                        | CTV                    |                        |                       |                        |
|-----------------------|---------------------------|-----------------------|------------------------|------------------------|------------------------|-----------------------|------------------------|
| 3 <b>D</b>            |                           | 2D                    |                        | 3D                     |                        | 2D                    |                        |
| Dose% (Mean- max min) | Mean Total<br>Volume (cc) | Dose% (Mean- max min) | Mean Total Volume (cc) | Dose% (Mean- max min)  | Mean Total Volume (cc) | Dose% (Mean- max min) | Mean Total Volume (cc) |
| 92.35<br>(107.7-77.7) | 193.54                    | 97.5<br>(106.2-88.8)  | 193.54                 | 100.95<br>(107.2-94.7) | 89.96                  | 99.2<br>(106.1-92.3)  | 89.96                  |

# Results

**Table 2:** the average dose delivered to PTV for 2D and 3D

| PTV (95%) |      | PTV ( | 107%) | PTV (105%) |       |  |
|-----------|------|-------|-------|------------|-------|--|
| 3D        | 2D   | 3D    | 2D    | 3D         | 2D    |  |
| 94.9      | 97.1 | 3.8   | 6.1   | 11.8       | 26.22 |  |

Results
Figure 3 The mean DVH for: PTV, Rectum, Bladder, right and left femur using 2D technique and 3D

### Conclusions

- 3D conformal radiotherapy is more effective than 2D conventional radiotherapy in decreasing dose to rectum, bladder and both hip but dose distribution, homogeneity and dose coverage to PTV the same.
- There were no statistical difference between 2D and 3D radiotherapy in terms of V95% or V107% keeping a minimum of 95% dose coverage for PTV and a maximum dose below 107% as recommended by the ICRU planning guidelines.
